

Workforce Exact Repo Merge Pack

Reference Guide

This guide explains the purpose, correct usage, and installation flow for the most repo-targeted version of the Workforce planning framework. It is designed for a repository that already uses **HN3T_MASTER_PLAN.md**, **PROGRESS_REPORT.md**, **scripts/run_plan.sh**, and **.github/copilot-instructions.md**.

Primary outcome Install a planning and execution framework into the current Workforce repo without replacing its existing conventions.	Best use Merge this pack into the repo, then use Copilot to execute one checkbox at a time from the atomic plan.
--	--

Included in the pack: templates, Workforce Studio example planning files, repo-targeted merge plans, root insert files, Copilot install prompts, and this reference PDF.

1. What this pack contains

The pack is organized for direct use in an existing Workforce-style repo. It extends the earlier planning packs by adding explicit merge guidance for the files you already use.

Group	Purpose	Typical use
docs/planning/templates/	Reusable planning framework files	Start new modules, standardize plan sections, define status vocabulary, decision rules, and progress-report structure
docs/planning/workforce_studio/	Concrete example module docs	Use Workforce Studio as the reference implementation for the planning framework
root_file_inserts/	Merge-ready file fragments and direct inserts	Copy or merge into root repo files and current instructions
merge-plan files	Exact file-targeted merge guidance	Merge into HN3T master plan, progress report, Copilot instructions, and run-plan flow
copilot install prompts	Copilot-friendly install instructions	Tell Copilot how to merge the framework into the repo safely
reference materials	Human-readable guide and PDF	Review before installation or hand off to another builder

Use the templates as the reusable system. Use the Workforce Studio files as the worked example. Use the merge-plan files when you want to integrate the framework into the current repo without replacing existing files.

2. Highest-value files

- **COPILOT_INSTALL_INTO_CURRENT_WORKFORCE_REPO__EXACT_PROMPT.md** — the strongest single prompt for telling Copilot to merge the framework into the current repo.
- **MERGE_PATCH_PLAN__HN3T_MASTER_PLAN.md** — exact guidance for merging the Studio sections into the master plan.
- **MERGE_PATCH_PLAN__PROGRESS_REPORT.md** — how to standardize progress tracking without erasing current history.
- **MERGE_PATCH_PLAN__github_copilot-instructions.md** — how to append the planning appendix without replacing current repo instructions.
- **RUN_PLAN_DECISION_RULES.md** and **PLAN_STATUS_VOCABULARY.md** — the control layer that keeps execution consistent.

3. Recommended installation workflow

- 1 Read **INSTALL_INTO_EXISTING_WORKFORCE_REPO__EXACT_CONVENTIONS.md** to understand the intended merge path.
- 2 Copy the **docs/planning/** tree into the repo.
- 3 Merge the two Studio plan sections into **HN3T_MASTER_PLAN.md**.
- 4 Merge or create **PROGRESS_REPORT.md** using the provided templates and status vocabulary.
- 5 Append the planning appendix into **.github/copilot-instructions.md** instead of replacing the file.
- 6 Review the run-plan integration notes before modifying **scripts/run_plan.sh**.
- 7 Use the exact Copilot install prompt to generate a merge-only diff.

Important: this pack is meant to **augment** the current repo, not replace its existing build, test, tenancy, RBAC, or architectural instructions.

4. Correct usage of the planning files

File	Correct usage
MODULE_SPEC_TEMPLATE.md	Create or refine a module spec before turning it into a plan section.
MASTER_PLAN_FORMAT_STANDARD.md	Normalize the structure and wording of future master-plan sections.
PLAN_STATUS_VOCABULARY.md	Keep plan, progress, and executor state language consistent.
RUN_PLAN_DECISION_RULES.md	Drive execute / skip / block / retry behavior when a task is selected.
COPILOT_EXECUTE_ATOMIC_TASK.md	Force Copilot to implement only one checkbox and return unified diff output only.
PROGRESS_REPORT_TEMPLATE.md	Track exact checkbox progress, files touched, tests run, and blockers.

5. Exact merge targets in the current repo

This pack is designed around specific Workforce repo files. The table below summarizes what each target should receive from the pack.

Target file	What to merge	What not to do
HN3T_MASTER_PLAN.md	Add the Studio build-order and atomic-execution sections	Do not replace the whole master plan
PROGRESS_REPORT.md	Add or merge atomic-task tracking structure and status vocabulary	Do not erase current progress history without a reason
.github/copilot-instructions.md	Append the planning appendix and atomic execution guidance	Do not replace existing repo-specific instructions
scripts/run_plan.sh	Align behavior with decision rules and one-checkbox execution	Do not rewrite the script blindly if it already works

The merge-plan files in the pack exist specifically to make these decisions easier and safer.

6. Workforce Studio example files

The Workforce Studio documents are not just filler. They are the worked example that proves the framework can support a real module from spec through atomic execution.

- **WORKFORCE_STUDIO_IMPLEMENTATION_SPEC.md** — the design and architecture source.
- **WORKFORCE_STUDIO_COPILOT_HANDOFF.md** — the build-oriented handoff for implementation.
- **HN3T_MASTER_PLAN_WORKFORCE_STUDIO_BUILD_ORDER.md** — a phase-oriented master-plan section.
- **HN3T_MASTER_PLAN_WORKFORCE_STUDIO_ATOMIC_EXECUTION_PLAN.md** — an atomic, run-plan-friendly section.

7. Best practices when using this pack with Copilot

- Use the install prompt first, then switch to the atomic execution prompt once the framework is merged.
- Keep the master plan mostly plain checkboxes; keep rich state in the progress file.
- Treat one checkbox as one patch target.
- Reject output that does not start with **diff --git** when running atomic tasks.
- Record skip, block, and retry outcomes instead of silently discarding them.
- Do not let the planning framework weaken tenant isolation, RBAC, or the Studio design-only boundary.

8. When to use each prompt file

Prompt file	Use it when...
COPILOT_INSTALL_INTO_CURRENT_WORKFORCE_REPO__EXACT_PROMPT.md	You want Copilot to merge the planning framework into the current repo
COPILOT_EXECUTE_ATOMIC_TASK.md	You want Copilot to implement a single checkbox only
COPILOT_EXECUTION_WRAPPERS.md	You want ready-made wrapper text around exact task execution
docs/planning/copilot_install/COPILOT_INSTALL_WORKFORCE_PLANNING_SETUP_PROMPT.md	You want a more general planning-framework install prompt

9. Quick-start sequence

- 1 Open this PDF and the install guide.
- 2 Copy the ``docs/planning/`` tree into the repo.
- 3 Merge the Studio plan sections into ``HN3T_MASTER_PLAN.md``.
- 4 Create or merge ``PROGRESS_REPORT.md``.
- 5 Append the planning appendix into ``.github/copilot-instructions.md``.
- 6 Use the exact install prompt with Copilot to generate the merge patch.
- 7 Once installed, use the atomic execution prompt against the Studio atomic plan or future module sections.

10. Final recommendation

The cleanest way to use this pack is to treat it as a planning/control layer for the repo. Let the current repository remain the source of code conventions and implementation history; let this framework standardize how modules are specified, planned, executed, and tracked.

This exact-merge pack is the best fit when you want a disciplined Copilot workflow inside the current Workforce repository rather than a generic planning bundle.
